

Resource Center URL Help Links

Last Updated: September 28, 2026

Note: This is custom code, contributed to the Pendo snippets repo. It is offered with no support from Pendo Customer Support — it is owned and maintained by whoever installs it.

This snippet turns a single help button into a page-aware help button. Instead of always opening the same generic support homepage, the button looks at the page the visitor is currently on, matches it against a short list of keywords, and opens the specific help article for that page in a new tab. If nothing matches, it falls back to the general support home page, so there is always a safe default.

The same help button, the same code — the destination changes automatically as the visitor moves between pages.

How It Works

The script keeps a small lookup table (a “keyword map”) of page keywords to help-article URLs — for example, “accounts” maps to the Managing Accounts article, “contacts” maps to Managing Contacts, and so on. On click, it reads the current page’s URL, checks it against each keyword in order, and opens the first match. If none of the keywords match, it opens a general support homepage instead, so the button is never a dead end.

- Reads the current page the visitor is on.
- Tests each entry in the keyword map against the current page, in order.
- Opens the matched article in a new tab, so the visitor never loses their place.
- Falls back to a general support homepage when no keyword matches.

Setup

Add a button or icon with the id `pendo-help-center-btn` wherever the help button should live (in the app, or inside a Resource Center module), then paste the JS and CSS files into a custom code block. Update the keyword map with your own page keywords and article URLs — no other configuration is required. Full code:
